Adoption of new learning technologies has to be led. So what do you think we need to do to be successful?
Who should be held accountable for adoption?

Why do or don’t metrics like accounts, and licenses work for ROI?

Who should be held accountable for the adoption of new technologies?

With a focus on cost and budgets, often times companies never get to adoption, “later never comes”. Can you explain what might be a better approach?

If the true ROI of investment in technology is collaboration among employees, smart decision making and sharing of knowledge and best practices, and behavior changes how do companies get there?
What do you see as the difference between deployment and adoption and what strategies do you suggest?

“We’ve spent an awful lot of money on technology, but I still see people working in the same old ways.” Why don’t companies actually use the technology they have purchased?

How do you suggest companies embed new work practices, work flows, and processes into an existing organizational culture?
Why might businesses want to do "fewer things better? Explain why it is important to focus on initiatives that will create real value and finishing what you start?

Explain the benefits of leadership engagement and leading by example?

How do you see the role of leadership in changing the mind sets and behaviors of an organization and implementing new technologies?

What approaches might you suggest to increasing true and lasting value?
Thank You!
